The Opportunity

Laisamis Constituency in Marsabit County, northern Kenya, is one of the most significant untapped climate technology deployment environments in Africa. We are offering international climate technology companies something that is genuinely difficult to find: accessible, community governed ASAL land for real world piloting of climate technology at scale, with local workforce, diverse ecological conditions, and a constitutional governance framework.

This is a structured climate technology testbed. A region where solar, water harvesting, soil sensing, rangeland restoration, and related technologies can be deployed, tested, and proven under genuine African dryland conditions. ASAL regions cover 80% of Kenya and approximately 40% of sub Saharan Africa. Technology proven here is technology proven for one of the world's largest underserved markets.

What We Provide

- Land access: ancestral land across 4 ecological zones, formally structured
- Community consent: NLC witnessed formal resolutions, not informal agreements
- Legal structure: Community Land Act 2016 compliant, NLC oversight
- Local workforce: Youth population trained as field monitors and technicians
- Ecological diversity: Highland forest to extreme desert in one constituency
- Scale: Multi site, multi variable pilots simultaneously possible
- Political backing: MP and Governor as community conveners
- Institutional anchor: NLC, Kenya's constitutional land body

Four Ecological Zones

- | | |
|--|---|
| <ul style="list-style-type: none">Zone II: Highland Forest · Mt. Kulal, up to 1,000mm rainfall, altitude to 2,066m. High biodiversity and conservation value. | <ul style="list-style-type: none">Zone V/VI: Arid Bushed Grassland · 300 to 900m. Primary testbed zone. Solar, water harvesting, remote sensing at scale. |
| <ul style="list-style-type: none">Zone IV: Semi Arid Mid Slopes · Transitional zone. Soil health measurement, agri climate data, and solar irrigation potential. | <ul style="list-style-type: none">Chalbi/Kaisut Desert · Extreme aridity. Highest solar irradiance in East Africa. Atmospheric water and DAC conditions. |

Communities: Rendille, Samburu, Gabbra, El Molo, Turkana · UNESCO Mt. Kulal Biosphere Reserve within constituency · Lake Turkana Wind Power (310MW) adjacent

"The same geography that hosts Africa's largest wind power project, 310MW at Lake Turkana, is available for your climate technology pilots. Large scale infrastructure in this region is not theoretical. It has been proven."

Technology Domains Sought

- | | |
|--|---|
| <ul style="list-style-type: none">Solar irrigation and off grid energy systems | <ul style="list-style-type: none">Rangeland monitoring and restoration technology |
| <ul style="list-style-type: none">Atmospheric water harvesting and rainwater capture | <ul style="list-style-type: none">Satellite and remote sensing validation |
| <ul style="list-style-type: none">Soil sensing and restoration measurement | <ul style="list-style-type: none">Agri climate data and weather forecasting systems |

Governance Structure

The governance failures that have damaged high profile African land projects follow a consistent pattern: weak community consent, no legal anchor, and benefits captured by intermediaries. The Laisamis initiative has been designed specifically to prevent this.

- National Land Commission (NLC): Constitutional body under Article 67, mandated to oversee community land registration. Already conducted 9 sensitisation forums across all 5 wards in 2024/2025. Institutional anchor that no individual or NGO can override.
- Community Land Trust: Being established with elected ward trustees. Benefit sharing agreements embedded from the start. Community owned, not NGO managed.

- Marsabit County Government: Formal institutional cover through County Land CECM. Documented county support ensures continuity beyond election cycles.
- Politicians as conveners only: The Laisamis MP and Marsabit County Governor open community assemblies and endorse the process. Governance authority rests with the NLC and Community Land Trust.

Legal note: Parcels within the constituency that are subject to an active High Court case are explicitly excluded from any commitment until legal status is resolved. All partner agreements are scoped only to undisputed community land with clear NLC registration.

Our Position on Carbon

LCLI takes no carbon finance, brokers no carbon deals, and holds no carbon partnerships. No carbon contract moves forward on community land until that land is registered under the Community Land Act and the community has given free, prior and informed consent through its own ward assemblies, not the signature of one leader. Communities already inside existing carbon projects can request independent paralegal support to review their contracts and exit if they choose.

Why this position is firm: In January 2025, the Isiolo Environment and Land Court found that two of the largest conservancies in the Northern Kenya Rangelands Carbon Project had been established unconstitutionally. Verra, the project's certifier, has since suspended it twice. In June 2026, Survival International reported that Rendille and Maasai members of the Melako and Leparua conservancies described being pressured to sign new carbon agreements.

What We Are Asking From Partners

We are not asking for charity or grant funding as a primary ask. We are offering a commercially structured partnership. Partners bring technology and capital. We provide land, consent, governance, and workforce.

- Climate technology accelerators: connect us with portfolio companies seeking African ASAL pilot environments
- Technology companies: enter a formal pilot deployment agreement with defined land zones, timelines, and benefit sharing terms
- Development finance institutions: fund the community engagement, land registration, and early infrastructure that makes the testbed viable
- Research institutions: access four ecological zones for climate data collection under a formal research partnership

About the Initiative Lead

Hamed Nalle is a community development practitioner and social innovator based in Laisamis Constituency. Son of the late Ntepesi Nalle, a respected Laisamis community leader, Hamed brings deep community relationships, grassroots mobilisation experience through the Feiyah Action Network and Marsabit Youth Reform Program, and a growing focus on technology and digital innovation as tools for scaled community impact.

LCLI is a new program launched under the Feiyah Action Network (FAN), a registered Community Based Organization in Marsabit County. Funding and partnership agreements are received and administered through FAN's registered legal structure.

Ready to explore a partnership?

We can share full land classification data, ecological zone maps, NLC engagement documentation, and a proposed partnership framework. A 30 minute call is the best starting point.
